

BYK Additives

Reduced to the essential: perfection

For some things, achieving the perfect result takes time. And BYK viscosity reducers are perfect for these cases. In the production of PVC plastisols, for example, they ensure the precise adjustment of the viscosity – in every single process step. Whether you use them to reduce viscosity in the liquid phase of the plastisol or for long-term stability: BYK additives optimize production processes and product quality – for perfect PVC plastisol applications.
